## NeoColab\_REC\_CS23231\_DATA STRUCTURES

REC\_DS using C\_Week 6\_COD\_Question 1

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

#### 1. Problem Statement

John and Mary are collaborating on a project that involves data analysis. They each have a set of age data, one sorted in ascending order and the other in descending order. However, their analysis requires the data to be in ascending order.

Write a program to help them merge the two sets of age data into a single sorted array in ascending order using merge sort.

#### **Input Format**

The first line of input consists of an integer N, representing the number of age values in each dataset.

The second line consists of N space-separated integers, representing the ages of participants in John's dataset (in ascending order).

The third line consists of N space-separated integers, representing the ages of participants in Mary's dataset (in descending order).

#### **Output Format**

The output prints a single line containing space-separated integers, which represents the merged dataset of ages sorted in ascending order.

Refer to the sample output for formatting specifications.

### Sample Test Case

```
Input: 5
113579
  108642
  Output: 1 2 3 4 5 6 7 8 9 10
  Answer
  #include <stdio.h>
  void merge(int arr[], int left[], int right[], int left_size, int right_size) {
     int i = 0, j = 0, k = 0;
     while (i < left_size && j < right_size) {
       if (left[i] < right[j]) {
         arr[k++] = left[i++];
       } else {
          arr[k++] = right[j++];
     while (i < left_size) {
       arr[k++] = left[i++];
     while (j < right_size) {
       arr[k++] = right[j++];
     }
  }
  void mergeSort(int arr[], int size) {
     if (size < 2) return;
    int mid = size / 2;
     int left[mid], right[size - mid];
```

```
2116240801331
left[i] = arr[i];

for ':
           for (int i = 0; i < mid; i++) {
           for (int i = mid; i < size; i++) {
             right[i - mid] = arr[i];
           }
           mergeSort(left, mid);
           mergeSort(right, size - mid);
           merge(arr, left, right, mid, size - mid);
        }
                                                                                              2116240801331
        int main() {
           int n, m;
           scanf("%d", &n);
    int arr1[n], arr2[n];
           for (int i = 0; i < n; i++)
             scanf("%d", &arr1[i]);
           for (int i = 0; i < n; i++) {
             scanf("%d", &arr2[i]);
           int merged[n + n];
           mergeSort(arr1, n);
           mergeSort(arr2, n);
                                                                                              2116240801331
                                                              21762408013331
 , σιι ι, arr2, n,

ριίτι = 0; i < n + n; i++) {

printf("%d ", merged[i]);

}

return 0:
           merge(merged, arr1, arr2, n, n);
```
